

ABSTRACT

2

3 Methods are provided for preventing a cellular immune response to a pre-selected antigen by ex
4 vivo or *in vivo* methods whereby dendritic cell maturation is permitted to occur in the absence of
5 effective CD4+ T cell help. Under these conditions, elimination of cytotoxic T cells is achieved.
6 The methods may be used for the prophylaxis of an undesired immune response to an
7 autoimmune disease antigen, a transplant antigen, or reducing an exaggerated immune response
8 to a antigen.
